

Usage

For information on the general use of the WHMCS Notification System, please read the following article: [WHMCS Notifications](#)

When using the module, there is nothing special to note. It works exactly as you imagine it: A complete integration into the WHMCS Notification system.

In addition to the basic functions of WHMCS, the module offers 3 additional configurable settings:

- Message Color
- Replace the default webhook URL with a custom webhook URL to post messages in different channels
- Customize the primary display message shown in the notification

Option: Message Color

This option defines the border color in which the message should be displayed. Green, yellow and red is available to choose from.

Option: Replace Webhook URL

This option allows you to override the default Webhook URL to send messages to other channels or to another team.

Option: Custom Message

This option overrides the default text of WHMCS with your own text. This has no influence on the facts list. Only the main text is overwritten.

Edit Notification Rule

Rule NameMail Notifications by Detect Multi Accounts

Event

Choose an event. You may select multiple events within any given event category.
