

# Version 2 Updates (>2017)

## Version 2 Updates

This is the recommended update method for version 2.0.0 or higher. You can check your current version in WHMCS under "Setup" "Addon Modules".

### General information about the update process

- Updates keep the module settings as they are.
- New features are not automatically activated to keep the original state. Please pay attention to the [release notes](#) to see what's new right away.
- To update to the latest version, you must not update to every single version between. You can make a direct update to the highest version - e.g. version 2.0.0 to version 2.2.0.
- Template and language changes are noted in the [release notes](#).
- When we make adjustments to the language files, the new adjustments are always at the bottom of the language file with a note about the version in which the string was adjusted or added.

### Follow these simple steps to update the module to the latest version

1. Upload the extracted module into your WHMCS installation.
2. Click **Addons NOC-PS For WHMCS** to open the module admin page. This will update the module database to the new version.
3. The upgrade has been completed.
