Usage

> For information on the general use of the WHMCS Notification System, please read the following article: **WHMCS Notifications**

When using the module, there is nothing special to note. It works exactly as you imagine it: A complete integration into the WHMCS Notification system.

In addition to the basic functions of WHMCS, the module offers 2 additional configurable settings:

- Customize the primary display message shown in the notification
- Different recipients can be configured for each notification, which overwrites the global setting.

Option: Custom Message

This option overrides the default text of WHMCS with your own text.
This has no influence on the facts list. Only the main text is overwritten.

Option: Custom Receivers

Use this option to override the default recipients. If you want to specify multiple recipients, separate them with spaces.

Edit Notification Rule   ✕

Rule Name	Invoices

Event

Choose an event. You may select multiple events within any given event category.

[Ticket] [**Invoice**] [Order] [Service] [Domain] [API]

```
Created
Paid
Cancelled
Refunded
```

Conditions

The following conditions can be applied to restrict when this rule is executed.

Total Due   **Client Group**
