Tools

Run Import

Clicking this link will try to find and import all existing free domains and assign the domain to the related product.

Resync Domain Settings

If you have done changes which affects the module, you can force a manual consistency check.

The following tasks will be executed:

- Ensure that the correct client id is deposited in the module database
- Ensure that domain privileges matches with the settings of the ACL group (DNS Management / Email Forwarding)
- If you change the Free Domain setting at the WHMCS product configuration ("renew as normal" <=> "free renewal"), it will update the renewal pricing for the related domains.

This function is also automatically executed when the WHMCS cronjob gets executed and ensures the consistency of your system.
