

Developer: Hooks

The following hooks are currently available:

- `after_send_mail`
- `before_send_mail`

These hooks are always executed as soon as a reminder mail is sent.

The hook files can be found in the module directory at the subdirectory "hooks".

After Send Mail

You can execute custom code after a mail has been sent.

Before Send Mail

With "`logActivity (json_encode($MailVars))`" you can get an overview of all mail variables.

- You can extend this array and add custom template variables, which will then be available in your mail template.
- You can override the existing values (e.g. subject, mail template name, etc.)

Setting "`$abortMail`" to "abort" does abort sending the current mail.
