ACL Groups

ACL (Access Control List) Groups can be created under the tab **ACL Groups** and assigned to specific domains on the **Home** page. With these options you can specify the permissions at the client area.

> **(i) Example**
>
> You do not want that your client can get the transfer code for his free domains and he should not be able to change the nameservers.
> To configure this, change the setting **Nameservers** and **EPP Code** to "No".
> The ACL Group of the domains can be changed at the tab **Home**.

A default ACL group can be selected at the Module Setting page. This group will be applied to new free domain activations.

Default ACL Group	Limited Access ▼
	When a free domain get activated, the following ACL group will be applied.
	The ACL groups can be used to limit client's management options at the WHMCS domain product page.
