

Skip check on configuration error

If you locked yourself out of WHMCS due to a faulty configuration, you can temporarily disable the login check of the module. Follow this steps to disable the module temporary:

1. Login via FTP to your WHMCS server and navigate to the directory `"/modules/addons/adminloginnotify/"`
2. Create the file `"disable_flag"`

Now you can login into WHMCS and correct the module configuration.

After you have fixed the issue, please remove the file `"disable_flag"` again to reactivate the login checks.
