# Stock Monitor

Stock Monitor automatically updates the quantity of available servers in the WHMCS product. Stock Monitor uses the regular stock control function of WHMCS.

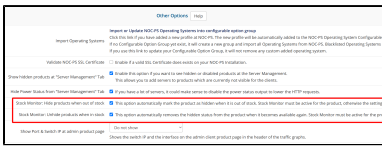

## Features

- The Server Management page allows to enable or disable Stock Monitor for each product individually.
- It can be configured that out-of-stock products are automatically marked as hidden, so that clients can't order these products.
- It can be configured that products which are available again are automatically unhidden.
- Every change by the module is recorded in the module log of the module.

## How to activate

To activate the function, you have to activate Stock Control in the product setting:

1. Click on "Setup"  "Products/Services" and open the corresponding product.
2. Activate the checkbox at "Stock Control". You must not insert the current amount of available servers.
3. Open the module page via "Addons"  "NOC-PS For WHMCS".
4. Click on the Stock Monitor button at the corresponding product to enable the feature.

After activation, the module will automatically update the amount of available servers and keep it in sync. To confirm, click on "Activity Log" in the module menu.

## Automatically hide / unhide products

To automatically hide or unhide products based on the quantify, open the module settings via "Addons" "NOC-PS For WHMCS"  "Settings" and activate following options:

- Stock Monitor: Hide products when out of stock
- Stock Monitor: Unhide products when in stock

These settings are found at the bottom of the page, at the category "Other Options".
