Admin Reinstallations

Since version 2.4.0, WHMCS admins can boot the server into rescue mode or reinstall the server directly via the admin product management. This means that a login to the WHMCS client area or to NOC-PS is no longer necessary.

Features and behaviour

- If pre-run profiles are configured, the module will run the profile before the actual OS installation.
- After starting the installation, admins can follow the installation status in the modal.
- Clients see in the client area that the server is currently being reinstalled. Clients can also track the installation status.
