

# Build dependency logic

The dependency logic builder offers the creation of complex dependencies. All configurable option types are supported, in detail these are:

- Quantity
- Yes/No
- Radio
- Dropdown

For each option type, you can specify what the value must be (or must not be) for the condition to be met. Furthermore a subdivision in several subgroups is possible with AND / OR conditions.

The groups can in turn be linked to the other groups in a AND/OR conditions, so that very complex dependency groups are possible.
