

Welcome Mail

Operating system can be [selected by client during checkout](#).

If you do not let your clients select which operating system they want, the default operating system will be installed. The default operating system can be selected at the [module settings](#).

When the module provisions a new server (either after payment or when you click "Create"), a welcome email can be sent to the client. A mail template must be assigned to the product in order to send the email. Select the desired template within the product options, as shown:

| | |
|---------------|---|
| Welcome Email | <div>Dedicated/VPS Server Welcome Email ▼</div> |
|---------------|---|

If an operating system was configured with an additional username, the variable `$additional_os_user` gets passed to the mail template.

The following is an example of a mail template:

```
Dear {$client_name},

{$service_product_name}

Hostname: {$service_domain}
Server IP: {$service_dedicated_ip}
Username: {$service_username}
Password: {$service_password}

{if $additional_os_user}
Please use following login for SSH:
Server IP: {$service_dedicated_ip}
User: {$additional_os_user}
Password: {$service_password}
{/if}

You can connect to your server in around 15 minutes. Currently an operating system installation is in progress.
The installation status can be viewed at our client area.

{$signature}
```

The client can view the installation status in the client area.

The module does automatically discover the admin username. The variable `$service_username` will be "root" for linux / unix systems and "Administrator" for Windows.
