Version 2 Updates (>2017)

Version 2 Updates

This is the recommended update method for version 2.0.0 or higher. You can check your current version in WHMCS under "Setup" "Addon Modules".

General information about the update process

- Updates keep the module settings as they are.
- New features are not automatically activated to keep the original state. Please pay attention to the release notes to see what's new right away.
- To update to the latest version, you must not update to every single version between. You can make a direct update to the highest version - e.g. version 2.0.0 to version 2.2.0.
- Template and language changes are noted in the release notes.
- When we make adjustments to the language files, the new adjustments are always at the bottom of the language file with a note about the version in which the string was adjusted or added.

Follow these simple steps to update the module to the latest version

1. Upload the extracted module into your WHMCS installation.
2. Click **Addons NOC-PS For WHMCS** to open the module admin page. This will update the module database to the new version.
3. The upgrade has been completed.
